

Agricultural Development□

Moravian area has largely developed the food industry. Even the DOE water corridor helps greatly, especially by reducing the costs of transporting of products - such as grain and fertilizer. Allows the export of these products to distant destinations to which land transport - road and rail - is too expensive. Water transport can also easy transport oversized farm machinery (combines, plows, seeding, shiniest plane, bulk transport trailers, etc.).□

Water transport ensure economical transport of agricultural products. On the picture inland vessel to transport flour.□

Project of inland vessel for transporting goods on pallets

Water transport can supply stores and supermarkets by the goods in containers or pallets and is suitable for all types of goods and foodstuffs.□

Use of agricultural land for the construction of DOE corridor will be fully compensated by the creation of new bodies of water used also for fish farming purposes. DOE will ensure sufficient water for irrigation of fields even if there will be adverse development of the

climate in the future.

In the area of South Moravia, irrigation is necessary, DOE will ensure water for agriculture
